

HW 3

During the lab, the group tested a few different things from the data. Compared people vaccinated status how that might affect his or her work if working on-site/in the office versus if working from home. Then tried age and vaccination status in addition of adding sexual orientation to see the data that was produced. It's interesting to see and compare the different results of people who work in the office and at home. Also, factor in the idea of how a certain job may require to be vaccinated before returning to work.
